Subject: Letter of Intent — Investment & Mentorship Support for SmartDrive Assist

Dear Ivaan, Siraaj and Utsa,

I am writing to you as an angel investor and a serial entrepreneur — having previously co-founded OfBusiness and Oxyzo, both of which went on to become unicorns. I have spent most of my career around founders, and it is genuinely rare to see a team of any age look at a real-world problem, refuse to be intimidated by it, and then build a working answer. That is exactly what the three of you have done with SmartDrive Assist — an AI-assisted, joystick-controlled kit that turns any ordinary wheelchair into a powered one. The idea is simple, the impact is enormous, and the engineering behind it is serious. This letter is to formally communicate my intent to back you.

Why this conviction:

- **Technical depth.** Your work has been reviewed and validated by Prateek Madhav, CEO of AssisTech Foundation (ATF) — and ATF does not hand out endorsements lightly. The feedback confirmed that what you have built is feasible, scalable, and capable of pulling down the cost barrier in a market that has stayed expensive for decades.
- **Real users, real demand.** The recognition from the BraveHeart Soldier Foundation and the interest shown by the Department of Ex-Servicemen Welfare make one thing clear: there are veterans today who would benefit from your kit immediately.
- **Empathy, not assumption.** Most products are designed in a room. Yours was shaped by time spent at The Earth Saviours Foundation, listening to people who actually need a low-cost, reusable mobility solution. That field grounding is what separates a school project from a product.
- **National recognition.** Finishing as 2nd Runners Up at the Codeavour 7.0 National Round in Bangalore, against far older competition, tells me the same thing your mentors are telling me — this team can ship.

What I am committing to:

I am prepared to provide the seed funding and resources required to take SmartDrive Assist from its current prototype to a production-ready v2.0. Specifically, my support is intended to cover:

- Industrial-grade components — IATA-compliant batteries and high-torque motors built for daily, real-world use.
- Refining the universal bolt-on mechanism so the kit fits any standard wheelchair without modification.
- Funding the first pilot batch for deployment in shelter homes, where these units can begin changing lives from day one.
- Mentorship on product, manufacturing and go-to-market — drawing from my own journey of building two companies from zero — so the engineering and business decisions you make next are the right ones.

You have identified a problem that matters, built something that works, and earned the trust of people who do this for a living. My job now is to make sure the next stage — components, compliance, scale — does not become the thing that slows you down.

Keep building. I am with you.

Warm regards,

Nitin Jain

Angel Investor
